SECTION: AiTC sales guide. How to use this book. This is the AGI Aeronautics sales guide for AiTC. It teaches how to sell the platform. Read it as a working book: the marketing idea first, then how that idea is applied to AiTC, then the words you can use. It is for you, the person writing to air navigation services, academies, and universities. It is not a public brochure.

SECTION: AiTC sales guide. How to use this book. What the book will and will not do. The book teaches positioning, the buyer, the message, the first email, the follow-up, the trial, the demonstration, objections, and the two licence shapes. It includes every AiTC capability that is part of the product. It does not contain a public price. AGI Aeronautics states the figure in the written proposal for that organisation. It does not invent customers, results, or meetings.

SECTION: AiTC sales guide. How to use this book. How to ask the staff assistant. Ask one question at a time. Ask "how do I explain the replay" or "what do I write when an academy does not reply" or "which licence do I offer a university". The assistant answers from this guide and from the organisation directory together. If a fact is not in those documents, the assistant should say so.

SECTION: AiTC sales guide. Contents. Part one is the marketing method. Part two is the buyer. Part three is the product, taught so you can sell each capability. Part four is the message for each kind of organisation. Part five is the conversation: first email, silence, reply, discovery, trial, and demonstration. Part six is objections, price, the proposal, and what you do after a yes or a no.

SECTION: AiTC sales guide. Marketing method. What marketing means here. Marketing, in this sale, is the choice of one reader, one problem, and one next step. You are not trying to make AiTC famous in one email. You are trying to earn a short trial with the person who trains air traffic controllers, or with the person who can introduce you to them. A feature list is not a message. A message says what changes for that reader.

SECTION: AiTC sales guide. Marketing method. Attention, relevance, proof, request. Every email and every demonstration uses the same four moves. Attention: name their organisation and the training job. Relevance: name one problem they can recognise, such as hardware, a missing pseudo-pilot, or airspace that takes too long to build. Proof: offer to show one AiTC capability, not to claim a result you have not measured. Request: ask for a trial conversation, and only that.

SECTION: AiTC sales guide. Marketing method. One idea per message. A first email carries one idea. If you explain radar, tower, airspace, exercises, artificial intelligence, replay, voice, video, and the flight envelope in the first note, the reader remembers none of them. Choose the idea that matches the organisation. Save the rest for the reply and the demonstration. The book teaches all of the ideas so you can choose, not so you can send them all at once.

SECTION: AiTC sales guide. Marketing method. Specificity is the proof you have. You do not yet put a customer count or a percentage improvement in the letter, because this guide does not contain those figures. Specificity comes from their world: their city, their training role, their airspace, their published mailbox. Then it comes from a precise AiTC fact, such as "a country airspace can be created within minutes from an aeronautical information publication". Vague praise does not sell. A precise fact does.

SECTION: AiTC sales guide. Marketing method. The offer is a trial, not a contract. The first commercial offer is a trial of AiTC. A trial is a designed session in which they see radar and tower in the browser, on hardware they already have. You do not open with a licence, a signature, or a price. Price comes after they have agreed that the training problem is real and after they have seen the platform. The two licence shapes are explained later in this book.

SECTION: AiTC sales guide. Marketing method. Trust is what you refuse to say. You earn trust by leaving out claims you cannot show. You do not say they already agreed to a meeting. You do not say a country has been contacted unless the map shows a sent message. You do not name a simulator vendor or an ATM system that is not in the organisation record. You do not quote another provider’s contract as the price of AiTC.

SECTION: AiTC sales guide. The buyer. Three kinds of organisation. AiTC is offered to three kinds of organisation. An air navigation service trains controllers for its own operation and cares about its own airspace. A training academy runs courses and cares about instructor time, exercises, and equipment. A university teaches aviation and cares about access for students on ordinary computers. The product is the same. The first sentence changes.

SECTION: AiTC sales guide. The buyer. The sale is to a group. One mailbox receives the email. Several people decide. The training manager cares whether the exercise can be built and previewed. The instructor cares whether a human pseudo-pilot is required and whether a remote trainee can be seen. The technical reader cares that the simulation runs in the browser and does not depend on one operating system. The person who pays cares whether the licence is per user or for the organisation. Write the first email to the training problem. Expect the other questions later.

SECTION: AiTC sales guide. The buyer. The training manager. The training manager owns the quality of the exercise. Speak to that person about creating the exercise inside AiTC, previewing it before the session, placing a chosen number of aircraft on a route, and then moving the conflict and the traffic peak by hand. Also speak about seeing the traffic load in each sector. That is the manager’s control over the lesson.

SECTION: AiTC sales guide. The buyer. The instructor. The instructor has to run the session. Speak about artificial intelligence piloting, so a human does not have to sit at the other end and fly the aircraft. Speak about scripts that make aircraft act automatically. Speak about voice in the browser, ground-to-air and ground-to-ground. If the student is in another place, speak about video, so the instructor can see the trainee during the session. Speak about replay, so the debrief is the exercise again, not a video file.

SECTION: AiTC sales guide. The buyer. The technical reader. The technical reader asks what must be installed. The answer is a browser. AiTC runs radar and tower in the browser. It is hardware-agnostic. It does not depend on the operating system. An exercise can be opened in another location on the computers already in the room. Do not promise a particular server size, a particular browser version, or a certification that this guide does not state.

SECTION: AiTC sales guide. The buyer. The person who pays. The person who pays asks how the licence is shaped before they ask for a number. Explain the two shapes. A per-user licence is a price for each person who uses AiTC. An organisation licence is one agreement for the academy, the university, or the air navigation service. Then say that AGI Aeronautics puts the figure in the proposal. Do not invent a number in the email.

SECTION: AiTC sales guide. The buyer. How to tell which reader you have. Read the organisation record before you write. An air navigation service record often names an aeronautical information mailbox. A training academy record names a school. A university record names a faculty. If the record has no published email, do not guess an address. Use the correspondence on the map to see whether anyone has already been written to, and whether a reply has arrived.

SECTION: AiTC sales guide. The problem. Sell the change, not the module names. The reader already has some way to train. Your job is to name a change AiTC makes possible. The changes you may describe are the ones in this book: run radar and tower in the browser, build a country airspace within minutes, create and preview the exercise, let artificial intelligence pilot, replay a script instead of a video, speak and see the trainee in the browser, and show a real flight envelope. Do not add a change that is not in this list.

SECTION: AiTC sales guide. The problem. Hardware and place. Many training rooms are tied to a particular computer or a particular operating system. AiTC removes that tie. Because radar and tower run in the browser, a session can start on the hardware already there, and the same exercise can be opened from another location. Say that plainly. Do not say that every existing simulator must be thrown away. Say that a session no longer depends on one kind of machine.

SECTION: AiTC sales guide. The problem. The missing person at the other end. A traditional exercise often needs a human pseudo-pilot to fly the aircraft while the student controls. AiTC can pilot with artificial intelligence, using scripts written for that piloting. The instructor can run the exercise without a second person at the other end. This is one of the strongest reasons for an academy to try the platform. Say it when the reader trains with limited staff.

SECTION: AiTC sales guide. The problem. Airspace that is slow to prepare. An air navigation service cares that the training airspace is their airspace. In AiTC, airspace is created in the platform. It can be drawn by hand, or created with the artificial intelligence, from a file that comes from another simulator, from an aeronautical information publication, or from another file that contains the airspace information. An entire country airspace can be created within minutes. That sentence is for the air navigation service, not for every first email.

SECTION: AiTC sales guide. The problem. The exercise that cannot be checked. An instructor who cannot preview the exercise discovers the mistake during the lesson. In AiTC the exercise is created in the platform and previewed in the exercise-creation module. The creator tests the traffic picture and plans the exact exercise before a student sees it. Pair this with the assistant: ask by voice or text for aircraft on a route, then move the conflict and the peak by hand.

SECTION: AiTC sales guide. The problem. A debrief that is a heavy video. A video recording of a session is large. AiTC records the session as a script and plays that script back from the start. It is not a video recording and it is not an audio recording. The script reproduces the exercise. A script recording is a hundred times smaller, and more, than a video recording, so a large number of exercises can be stored. Say this when they ask how sessions are reviewed or archived.

SECTION: AiTC sales guide. The problem. A remote student who cannot be seen. If the instructor and the trainee are not in the same room, the instructor needs to see the trainee. The AiTC voice system runs in the browser and includes video calling. During a remote session the instructor can see the trainee. The same system simulates ground-to-air and ground-to-ground lines between connected users. Use this for remote training. Do not claim it replaces a national telephone network.

SECTION: AiTC sales guide. Positioning. The one sentence. AiTC is the AGI Aeronautics air traffic control simulator that runs radar and tower in the browser, so an academy, a university, or an air navigation service can run an exercise on the computers it already has, in any location, without depending on one operating system. Use this sentence when you need the whole product in one line. Then stop and add only the one capability that matches the reader.

SECTION: AiTC sales guide. Positioning. What you are not claiming. You are not claiming that AiTC is already the operational ATM system of the organisation. You are not claiming a regulatory approval that this guide does not state. You are not claiming that their current simulator vendor has failed. You are offering a training platform they can try. Keep the operational system they use, if the directory records one, as their system. AiTC is the training simulator you are asking them to trial.

SECTION: AiTC sales guide. Positioning. The category in the reader’s mind. Place AiTC in the category "air traffic control training simulator", and then add the difference: it runs in the browser, the airspace can be built from their files within minutes, the exercise can be previewed, and aircraft can be piloted by artificial intelligence. The category tells them what job it does. The difference tells them why a trial is worth an hour. Do not invent a second category, such as an operational control system.

SECTION: AiTC sales guide. Product lesson. Radar and tower in the browser. AiTC runs both radar simulations and tower simulations directly in the browser. A class can train on the radar picture and on the tower view without a separate installed simulator for each. How to say it: "You can open a radar exercise and a tower exercise in the browser, on the computers already in the room." Ask them which rating or lesson they teach first, aerodrome or surveillance, and start the trial there.

SECTION: AiTC sales guide. Product lesson. Any hardware, any location. Because the simulation is in the browser, an exercise can be run on the hardware the organisation already owns. The same exercise can be started in another room or another city. How to say it: "The session is not tied to one training workstation. If the person has a browser, they can join from the place they are." This matters for a university computer lab and for an instructor who is not on the same site as the student.

SECTION: AiTC sales guide. Product lesson. Operating system. AiTC does not depend on a particular operating system. You do not ask the organisation to standardise its computers before a trial. How to say it: "We do not ask you to change the operating system. The simulation is delivered in the browser." If they ask for a supported version list, say you will confirm the practical setup for the trial. Do not invent a version matrix in the email.

SECTION: AiTC sales guide. Product lesson. Airspace, two ways. Airspace is created inside AiTC. One way is manual: the creator draws the airspace in the platform. The other way uses artificial intelligence: the platform builds the airspace from a source file. How to say it: "You can draw the airspace yourself, or you can let the platform build it from a file you already have." Offer both. Some readers want control. Some want speed. The trial can show the way they prefer.

SECTION: AiTC sales guide. Product lesson. Which files can build airspace. The source file can be a file from another simulator, an aeronautical information publication, or any other file that contains the information needed to create the airspace. How to say it: "If you can give us the file that already describes the airspace, we can use it. That includes an aeronautical information publication." Ask them which file they trust. Do not promise that every format has been tested unless you have done that test.

SECTION: AiTC sales guide. Product lesson. A country airspace within minutes. An entire country airspace can be created within minutes. How to say it to an air navigation service: "We can create your country airspace in the platform within minutes from the file you provide." This is a product capability, not a promise that their validation is finished in minutes. Creation is fast. Their review of the result still belongs to them. Say both sentences so you do not oversell.

SECTION: AiTC sales guide. Product lesson. Exercises are created in the platform. The instructor does not wait for a separate exercise bureau. The exercise is built inside AiTC. How to say it: "Your instructor creates the exercise in the same platform the student will use." Then explain the preview. Creation without preview would still leave the mistake for the classroom. The next lesson is the preview.

SECTION: AiTC sales guide. Product lesson. Preview before the student sees it. The exercise-creation module can preview the exercise. The creator runs it, watches the traffic, and changes the plan before the training session. How to say it: "You can test the exercise in the creation module and decide that this is the lesson you wanted." Ask what a good exercise looks like for them: a conflict at a fix, a departure rush, a runway change. Then build toward that picture in the trial.

SECTION: AiTC sales guide. Product lesson. The exercise assistant. During creation, an artificial intelligence assistant accepts voice commands and text commands. The creator can ask for a certain number of aircraft on a specific route, or for particular aircraft types. How to say it: "You can say, or type, that you want eight aircraft of a given type on that route. The assistant sets that up. You remain in charge of the lesson." The assistant speeds the first draft. It does not replace the instructor’s judgement.

SECTION: AiTC sales guide. Product lesson. The instructor still places the difficulty. After the assistant creates the traffic, the creator adjusts by hand where the conflicts occur and where the traffic peak is. How to say it: "The assistant gives you the traffic. You decide where the conflict happens and where the peak sits." This sentence matters. Buyers fear that artificial intelligence will produce a random exercise. You are selling control: speed from the assistant, judgement from the instructor.

SECTION: AiTC sales guide. Product lesson. Traffic load by sector. For an exercise, AiTC shows the traffic that flows through each sector. The creator sees the volume, the traffic load, in those sectors. How to say it: "Before the lesson, you can see how heavy each sector is, and you can change the exercise if one sector is not the one you meant to stress." This is how a training manager checks that the exercise matches the objective. Use it in the demonstration, not only in the brochure.

SECTION: AiTC sales guide. Product lesson. Scripts for the aircraft. Inside the exercise-creation module, scripts make aircraft carry out actions by themselves. The aircraft follow the script automatically. How to say it: "You can write a script so an aircraft does a defined thing without someone steering it by hand for the whole exercise." A script is for a planned action. Artificial intelligence piloting, in the next lesson, is for flying the aircraft without a human pseudo-pilot. Explain them as a pair, then use only one of them in the first email.

SECTION: AiTC sales guide. Product lesson. Artificial intelligence piloting. AiTC can use scripts so artificial intelligence pilots the aircraft. A human does not need to sit at the other end and control the planes. How to say it: "Your instructor can run the exercise without a pseudo-pilot, because the aircraft are piloted by the artificial intelligence." This is often the reason an academy agrees to a trial. Offer it when they have more students than staff. Do not say the artificial intelligence replaces the instructor. The instructor still designs and assesses.

SECTION: AiTC sales guide. Product lesson. Replay is a script, not a video. Training sessions can be recorded and played back. The playback is not a video and it is not an audio recording. It is a scripted recording that reproduces the exercise from the start, inside the replay module. How to say it: "The debrief plays the exercise again from the beginning. You are looking at the session as it is reproduced, not at a film of the screen." Students and instructors can examine what happened. You may say they can see what happened in the exercise. Do not add analytics this guide does not describe.

SECTION: AiTC sales guide. Product lesson. Why the recording is small. A script recording is a hundred times smaller, and more, than a video recording of the same session. Because of that, the organisation can store a large number of exercises. How to say it: "You can keep many sessions, because the recording is the script of the exercise, and that script is vastly smaller than a video." Use "a hundred times smaller, and more" as the comparison. Do not convert it into a megabyte figure. This guide does not state a file size.

SECTION: AiTC sales guide. Product lesson. Voice in the browser. Voice communication runs in the browser. Users in the same session can use simulated ground-to-air lines and ground-to-ground lines. How to say it: "The student talks to the aircraft and to the other ground positions inside the browser. You do not set up a separate voice system for the trial." This supports a realistic exercise. It is a training simulation of those lines. Do not describe it as the operational telephone system of a centre.

SECTION: AiTC sales guide. Product lesson. Video so the instructor can see the trainee. The voice system also supports video calling. In remote training, the instructor can see the trainee throughout the session. How to say it: "If your instructor is not in the room, they can still see the student while the exercise runs." This is the answer to remote training. Pair it with the browser: both people join from the computers they have. The instructor sees the trainee. The exercise still runs in AiTC.

SECTION: AiTC sales guide. Product lesson. The aircraft is not a simple speed table. The aircraft database is built on a detailed flight envelope for each aircraft. Speed and altitude are not taken from a simple value table that guesses performance from altitude. The aircraft in the simulation follows that flight-envelope model, as a representation of the real aircraft based on the envelope. How to say it: "The aircraft behaves from its flight envelope, not from a single speed written next to an altitude."

SECTION: AiTC sales guide. Product lesson. The student can see the envelope. The flight envelope is visible inside the simulation. A student can open the graphic and see the limitations of the aircraft. How to say it: "When a student needs to understand why the aircraft cannot do what they asked, they can open the flight-envelope graphic in the simulation and see the limit." This is a teaching tool, not only a physics detail. Use it when the reader cares about aeronautical realism in the classroom.

SECTION: AiTC sales guide. Product lesson. How the capabilities fit in one session. A complete training story is this. The airspace exists in the platform. The instructor creates an exercise, previews it, and sets the conflict and the peak. Aircraft follow scripts or are piloted by artificial intelligence. The student works radar or tower in the browser, speaks on the simulated lines, and can be seen by video if the instructor is remote. The session is replayed from the script. The student can open the flight envelope. You do not tell this whole story in the first email. You tell it in the demonstration.

SECTION: AiTC sales guide. Message by reader. Air navigation service. Lead with their airspace. Subject idea: AiTC trial for [organisation] airspace training. First paragraph: AGI Aeronautics, and AiTC as a browser simulator for radar and tower. Second paragraph: their country airspace can be created in the platform within minutes from a file they already hold, such as an aeronautical information publication. Ask for a short conversation about a trial on that airspace. Do not describe the flight envelope in this first note.

SECTION: AiTC sales guide. Message by reader. Training academy. Lead with the instructor’s missing counterpart. Subject idea: AiTC trial for [academy] air traffic control courses. First paragraph: who you are, and that radar and tower run in the browser. Second paragraph: exercises are created and previewed in the platform, and artificial intelligence can pilot the aircraft so a human pseudo-pilot is not required. Ask for a trial on one lesson they already teach. Do not open with price.

SECTION: AiTC sales guide. Message by reader. University. Lead with ordinary computers and a lesson the student can inspect. Subject idea: AiTC for air traffic training at [university]. First paragraph: browser, no dependence on one operating system, usable in the lab they already have. Second paragraph: students can preview the idea of the exercise with the instructor, and they can open the flight-envelope graphic inside the simulation to see aircraft limits. Ask for a trial with one class or one lecturer. Keep the operational-airspace story for an air navigation service.

SECTION: AiTC sales guide. Message by reader. When the record is thin. Some organisations have a website and a mailbox and little published detail on their simulator. Do not fill the gap with a guess. Use the general sentence: radar and tower in the browser, on hardware they already have. Offer a trial. Ask one question: whether they train aerodrome control, surveillance, or both. Their answer chooses the demonstration. Silence on the simulator vendor is not a problem to solve by invention.

SECTION: AiTC sales guide. The sales process. The stages. The stages are these. One: choose the organisation on the map and read its record. Two: send one first email to the published mailbox. Three: if there is no reply, send the follow-up sequence in this book and then stop. Four: if they reply, answer the question they asked and offer the trial. Five: hold a discovery conversation. Six: run the demonstration. Seven: if they want to continue, send a proposal with the licence shape and the figure. Eight: record what happened in the correspondence, so the next note matches the truth.

SECTION: AiTC sales guide. The sales process. One organisation, one thread. Do not start a second first email to the same organisation while the first thread is open. Read the correspondence under the pin before you write. If a message was sent and no reply has arrived, you are in the silence sequence. If a reply has arrived, you answer that reply. If nothing has been sent, the pin is still a first contact. The map colours help you see this. Black means nothing sent. Blue means sent, with no reply. Green means a reply has been received.

SECTION: AiTC sales guide. First email. Who receives it. Send the first email to the published institutional mailbox on the organisation record. Prefer the office, enquiry, or training address. Do not replace it with a person’s name you found elsewhere. If several addresses are published, use the one the record lists first for correspondence, and you may name the role of the others only if you are answering a question about who else is published. One organisation receives one first email.

SECTION: AiTC sales guide. First email. Subject. The subject names AiTC and the organisation. Examples you may adapt: "AiTC trial for [organisation]", "Browser radar and tower training for [academy]", "A short AiTC trial on [country] airspace". Do not use a subject that pretends they requested a quote. Do not use urgency you have not earned, such as "last chance" or "closing today". The subject should be understandable if it is forwarded inside the organisation.

SECTION: AiTC sales guide. First email. Shape. Four short parts. One: AGI Aeronautics, and AiTC as a browser simulator for radar and tower. Two: one capability that matches this reader, in two or three sentences, using the words from the product lessons. Three: the ask, which is a short conversation about a trial. Four: the sign-off as AGI Aeronautics. The mailbox signature is added when the message is sent from the outbox. You do not paste a second signature into the draft.

SECTION: AiTC sales guide. First email. Words you can send to an academy. "AGI Aeronautics builds AiTC, an air traffic control simulator that runs radar and tower in the browser, on the computers a school already has. An instructor can create the exercise in the platform, preview it, and run it without a human pseudo-pilot, because the aircraft can be piloted by artificial intelligence. If this is relevant to a course at [academy], I would like to offer a short trial. Would you be open to a conversation?"

SECTION: AiTC sales guide. First email. Words you can send to an air navigation service. "AGI Aeronautics builds AiTC, a browser simulator for radar and tower training. Airspace can be created in the platform from a file you already use, including an aeronautical information publication, and a country airspace can be created within minutes. I am writing to ask whether [organisation] would try this on a sample of your airspace. I am not assuming a meeting is booked. If a trial is useful, tell me who should see it."

SECTION: AiTC sales guide. First email. Words you can send to a university. "AGI Aeronautics builds AiTC, an air traffic control simulator that runs in the browser and does not depend on one operating system. Students can train on radar and tower on the computers already in a lab. During a session they can also open the flight-envelope graphic and see the limits of the aircraft. I would like to offer [university] a short trial for one lecturer or one class. Are you the right person, or can you point me to them?"

SECTION: AiTC sales guide. First email. The ask, and only the ask. End with one request. The request is a conversation about a trial, or the name of the person who owns air traffic training. Do not also ask for a procurement form, a phone number, a list of their simulators, and a signed trial agreement in the same email. One request is easier to answer. If they reply with a question instead of a yes, that reply is a success. Answer it.

SECTION: AiTC sales guide. First email. Length. The first email should be readable on a phone in under a minute. If it is longer than about one hundred and fifty words, cut a capability, not the ask. The book is long so that you know the product. The email is short so that they read it. Anything you cut can return in the second message, after they have shown interest.

SECTION: AiTC sales guide. Silence. What silence means. No reply is not a decision. It often means the mailbox is shared, the reader is teaching, or the note was forwarded and stuck. You still follow a sequence, and you still stop. Waiting is part of the method. Sending a new version every day teaches them to ignore you. The sequence in this book is the whole silence plan.

SECTION: AiTC sales guide. Silence. The timing. Wait several working days after the first email. Then send follow-up one. Wait several more working days. Then send follow-up two. Then stop. Do not send a third follow-up unless they later write to you. "Several working days" means you leave enough time for a shared mailbox to be read. It does not mean you wait so long that the first email is forgotten. If you need a number for your own calendar, use five working days and then five again. Say that this spacing is your working rule, not a reply they promised.

SECTION: AiTC sales guide. Silence. Follow-up one. Refer to the first email in one line. Repeat the trial in fewer words. Add nothing new except one concrete detail that makes the trial easier to imagine. For an academy, that detail can be "one lesson you already teach, without a pseudo-pilot". For an air navigation service, it can be "a sample airspace from a file you choose". Do not apologise for writing. Do not say they missed a deadline.

SECTION: AiTC sales guide. Silence. Words for follow-up one. "I wrote last week about a short AiTC trial for [organisation]. AiTC runs radar and tower in the browser. The trial is one exercise, on computers you already have. If someone else owns air traffic training, I am glad to write to them instead. If the timing is wrong, tell me and I will close the note." The last sentence gives them an easy reply that is not a yes. An easy reply is better than silence, because then you know what to do.

SECTION: AiTC sales guide. Silence. Follow-up two. This is the last note in the sequence. It is shorter than follow-up one. It says the offer remains a trial, and that you will not keep writing unless they ask. How to say it: "This is my last note on an AiTC trial for [organisation]. If a browser-based radar and tower exercise would help a class or a course, reply and I will set it up. If not, I will leave it here." Then stop. Stopping is part of the professionalism you are selling.

SECTION: AiTC sales guide. Silence. What you must not invent during silence. Do not write that they asked for a proposal. Do not write that a colleague promised a meeting. Do not write that the offer expires on a date you chose alone, unless a real campaign date exists and you are willing to honour it. Do not attach the whole sales book. Do not add a price to "make them answer". Silence is handled by clarity and by stopping, not by pressure.

SECTION: AiTC sales guide. A reply. Answer the question they asked, first. The first sentence of your reply answers their question. If they ask whether it runs on their computers, answer the browser and the operating system. If they ask whether you need their airspace, answer the file and the minutes. If they ask who flies the aircraft, answer artificial intelligence piloting. Only after the answer do you return to the trial. People reply when the next email continues their sentence, not when it restarts your brochure.

SECTION: AiTC sales guide. A reply. If they ask about hardware. Say that AiTC runs in the browser and does not depend on a particular operating system. Say that an exercise can be run on the hardware already in the room and opened from another location. Offer the trial on a computer they choose. Do not ask them to buy a workstation for the trial.

SECTION: AiTC sales guide. A reply. If they ask about airspace. Say that airspace is created in the platform, by hand or with artificial intelligence. Say the source can be a simulator file, an aeronautical information publication, or another file that contains the airspace information. Say a country airspace can be created within minutes. Ask which file they want to use for the trial. Remind them that creation is fast and that they still review the result.

SECTION: AiTC sales guide. A reply. If they ask about staff. Say that scripts can make aircraft act automatically, and that artificial intelligence can pilot so a human pseudo-pilot is not required. Say the instructor still creates the exercise, previews it, and places the conflict and the traffic peak. The product removes the second pilot. It does not remove the instructor.

SECTION: AiTC sales guide. A reply. If they ask about remote students. Say that voice runs in the browser, with simulated ground-to-air and ground-to-ground lines, and that video calling lets the instructor see the trainee during the session. Offer a trial in which you and they are not in the same room, so they can judge this themselves.

SECTION: AiTC sales guide. A reply. If they ask about realism. Say that the aircraft follows a detailed flight envelope, not a simple table of speeds and altitudes. Say the student can open that graphic inside the simulation and see the limitations. Offer to show one aircraft in the trial. Do not invent a list of aircraft types beyond what you will actually open.

SECTION: AiTC sales guide. A reply. If they ask about recording. Say the replay is a script that reproduces the exercise from the start. Say it is not a video and not an audio file. Say a script is a hundred times smaller, and more, than a video, so many sessions can be stored. Offer to record the trial itself and play it back, so the claim is demonstrated rather than described.

SECTION: AiTC sales guide. A reply. If they ask for a price. Do not invent a figure. Say that AiTC is offered as a per-user licence or as an organisation licence. Say you will state the figure in a proposal after you know who will use the platform and which shape fits them. Ask the question that lets you choose the shape: how many people train at once, and is the buyer the whole organisation or a single course. Then return to the trial. A price without a trial is a guess they cannot judge.

SECTION: AiTC sales guide. A reply. If they say no. Thank them in one or two sentences. Do not argue. Do not send the silence sequence after a clear no. You may leave one door open: "If training plans change, I am glad to show a trial later." Then record the refusal in your own notes and stop. A no that is respected is how you remain able to write again in a later year.

SECTION: AiTC sales guide. A reply. If they are not the right person. Ask for the name of the person who owns air traffic control training, or for that person to be included. Do not keep selling the product to someone who has told you they cannot decide. How to say it: "Thank you. Who is responsible for air traffic training at [organisation]? I will write one note to them and I will say that you pointed me there." Then do exactly that. One introduction, one new email.

SECTION: AiTC sales guide. Discovery. Why you ask questions before you demonstrate. A demonstration that shows every module convinces nobody. A demonstration that shows their lesson convinces the training manager. Discovery is the short conversation in which you learn the lesson, the place, the staff, and the constraint. It can be the same meeting as the demonstration if time is short. Ask the questions first, then open the browser.

SECTION: AiTC sales guide. Discovery. Questions that choose the trial. Ask which they teach, radar or tower or both. Ask whether the student and the instructor are in the same room. Ask whether a second person usually pilots the aircraft. Ask whether they want to use their own airspace file or a sample. Ask what a successful lesson looks like: a conflict, a peak, a runway, a sector. Ask who else must see the trial before a proposal. Write the answers down. They become the demonstration plan and, later, the proposal.

SECTION: AiTC sales guide. Discovery. Questions you do not ask yet. Do not open discovery by asking for their budget, their current vendor’s price, or a criticism of their ATM system. Do not ask for a student list. Do not ask them to admit that training is failing. Ask about the lesson they want to run. The commercial questions wait until the trial has been useful.

SECTION: AiTC sales guide. The trial. What the trial is for. The trial answers one question the buyer has. For an academy, the question is often "can we run a lesson without a pseudo-pilot". For an air navigation service, it is often "can our airspace appear in the platform". For a university, it is often "can students use it on the lab computers". Write that question at the top of your plan. When the trial is over, ask whether that question was answered. Do not add a second goal in the room.

SECTION: AiTC sales guide. The trial. What they need to bring. They need a browser and a computer they already have. They do not need a particular operating system. They do not need a human pseudo-pilot if the exercise uses artificial intelligence piloting. If the trial uses their airspace, they bring a simulator file, an aeronautical information publication, or another file that contains the airspace information. If they cannot bring a file, use a sample and say that it is a sample.

SECTION: AiTC sales guide. The trial. What you prepare. Prepare one exercise, not five. Preview it yourself in the exercise-creation module. Know where the conflict is and where the traffic peak is. Know which sector should look busy if you show the traffic load. Decide whether aircraft are scripted, piloted by artificial intelligence, or both, and be ready to say which is which. If the instructor will be remote, test the video. If you will replay the session, know how you will start the playback.

SECTION: AiTC sales guide. The trial. How long. Plan a trial that fits in one sitting. A useful shape is a short introduction, the exercise, one replay, and time for their questions. If you cannot show airspace creation and a full exercise and the flight envelope and video in that sitting, choose the one that answers their question. Offer the others as a second sitting. Completeness is the book’s job. Focus is the trial’s job.

SECTION: AiTC sales guide. The trial. How you open the hour. Start with their question, in their words. "You wanted to see whether an instructor can run a tower lesson without a second person flying the aircraft. That is what this hour is for." Then open the browser on a computer in the room, or on theirs. The first proof is that it opened there. Say that. Then run the exercise.

SECTION: AiTC sales guide. The demonstration. Order of events. Use this order when they have asked for a full picture. One: open AiTC in the browser and say that this computer’s operating system is not a special requirement. Two: show radar, or tower, according to their lesson. Three: show the airspace, and if they brought a file, say where it came from. Four: show the exercise that was previewed, including the conflict and the peak. Five: show aircraft moving by script or by artificial intelligence piloting. Six: use the voice lines, and video if the instructor is remote. Seven: replay the session from the script. Eight: open the flight-envelope graphic. Nine: stop and ask if their question was answered.

SECTION: AiTC sales guide. The demonstration. What you say at each step. At the browser: "This is the simulator. Nothing was installed for this machine." At radar or tower: "This is the view your student would work." At airspace: "This airspace was created in the platform. A country airspace can be created within minutes from a file like yours." At the exercise: "I previewed this before we started. The conflict is here. The peak is here. I can move either." At piloting: "No one is sitting at another console to fly these aircraft." At replay: "This is not a video. The exercise is being reproduced from the script." At the envelope: "The student can open this and see the limit."

SECTION: AiTC sales guide. The demonstration. Let them touch it. A trial they only watch is a presentation. Ask the instructor to request a change: more aircraft on a route, a different type, the peak moved. Use the assistant by voice or by text, then adjust by hand. Ask them to look at the traffic load of a sector. If they change the exercise and recognise their own lesson, the trial has done its work. Do not rush past their hands back to your script.

SECTION: AiTC sales guide. The demonstration. What you do not show. Do not show a price slide in the middle of the exercise. Do not apologise for a capability you did not plan to show. Do not claim a certification, a customer, or a performance number that is not in this guide. If something in the trial does not work, say so and show the part that does. Honesty in the room is worth more than a perfect story that breaks.

SECTION: AiTC sales guide. Objections. They already have a simulator. Agree that they do. Then separate training access from the machine they already own. "You can keep the training programme you have. AiTC lets you run radar and tower in the browser, build airspace from a file you already possess, and preview the exercise before the class. The trial is the way to see whether that is useful beside what you use today." Do not attack the other system. You may not know it. The directory records a vendor only when a public source named it.

SECTION: AiTC sales guide. Objections. Information technology will not allow an installation. Answer with the browser. AiTC does not ask them to roll out a new operating system. The trial can happen on a computer their technical staff already accepts, because it is a browser session. Offer to include that person in the trial. A technical objection is often a request to be included, not a refusal of the training idea.

SECTION: AiTC sales guide. Objections. We do not have pseudo-pilots. This is the artificial intelligence piloting lesson. "The aircraft can be piloted by the artificial intelligence, so the instructor can run the session without a person at the other end. Scripts can also make aircraft perform planned actions automatically. You still design the exercise and you still decide where the conflict and the peak are." Offer to run the trial with no pseudo-pilot present.

SECTION: AiTC sales guide. Objections. Our students are in another city. This is the remote lesson. "Voice and video run in the browser. The instructor can see the trainee during the session, and the simulated ground-to-air and ground-to-ground lines are in the same session. The exercise is still radar or tower in the browser." Offer a trial in which you are the remote instructor, so they see the video work.

SECTION: AiTC sales guide. Objections. Recordings will fill our storage. This is the replay lesson. "The recording is a script that reproduces the exercise. It is not a video file. A script recording is a hundred times smaller, and more, than a video, which is why many sessions can be stored." Offer to record the trial and show the playback. Do not quote a disk size.

SECTION: AiTC sales guide. Objections. The aircraft will not be realistic enough. This is the flight-envelope lesson. "Performance comes from a detailed flight envelope, not from a simple table of speed against altitude. In the simulation the student can open the graphic and see the aircraft limits." Show one aircraft. If they want a type you have not prepared, say you will confirm it rather than pretending it is on screen.

SECTION: AiTC sales guide. Objections. Artificial intelligence will write a bad exercise. Separate the assistant from the instructor. "The assistant can take a voice or text request, such as a number of aircraft on a route or a set of aircraft types. You then move the conflict and the traffic peak yourself, and you can preview the whole exercise before a student sees it. You can also read the traffic load in each sector." The assistant drafts. The instructor decides.

SECTION: AiTC sales guide. Objections. We need our whole country, not a sample. "An entire country airspace can be created within minutes from a file that contains the airspace, including an aeronautical information publication. The trial can use a portion so you can judge the method, and the same method scales to the country. You still review the result." Ask for the file. Do not promise their operational validation is complete when the creation finishes.

SECTION: AiTC sales guide. Objections. Send the documents and we will read them. Send the one-sentence position and the trial offer. Do not send this whole book to a prospect. The book is your private guidance. A long attachment is how a first email dies. If they insist on something to forward, give them a short note in the email itself: browser, radar and tower, the one capability they asked about, and the invitation to a trial.

SECTION: AiTC sales guide. Objections. Call us next year. Accept the timing. Ask for the month when training plans are made. Write one sentence in your notes. Send one note when that month arrives, referring to this reply. Do not keep the silence sequence running through the year. A dated yes-later is a reply, not silence. Treat it with the respect you give a no: one plan, then quiet.

SECTION: AiTC sales guide. Objections. We need a formal tender. Agree. Ask what the tender must contain, and who receives it. Build the proposal from this book: what AiTC does, how a trial would work, and the licence shape. Put the figure in only when you are ready to stand behind it. Do not invent compliance claims to fit a form. If a form asks for a fact this guide does not contain, leave it for a direct answer rather than a guess.

SECTION: AiTC sales guide. Price. When to talk about price. Talk about price after the problem is clear and after a trial, or when they ask. If they ask early, answer the shape and defer the figure, as the reply lesson says. If you announce a number in the first email, the conversation becomes a discount discussion before they have seen radar, tower, or their airspace. The trial gives the number a meaning: this many people, this organisation, this use.

SECTION: AiTC sales guide. Price. The per-user licence. A per-user licence is a price for each person who uses AiTC. Offer this shape when the buyer is a course, a small class, or a team whose size they can name. Explain that the proposal will say who counts as a user. Do not decide, in the email, that a spectator or an administrator is free or billable. That definition belongs in the proposal you actually send.

SECTION: AiTC sales guide. Price. The organisation licence. An organisation licence is one agreement for the academy, the university, or the air navigation service. Offer this shape when many instructors and students will use AiTC, or when the buyer wants one decision for the whole school rather than a count of seats. Say that the proposal names the organisation and the figure. Do not describe it as unlimited if the proposal will contain a limit. This guide does not set that limit.

SECTION: AiTC sales guide. Price. How you choose the shape. Ask who will use AiTC in the next training period: one class, several courses, or the whole training organisation. A single course points toward a per-user licence. A whole academy or a whole air navigation training department points toward an organisation licence. You may offer both and recommend one. Say why in one sentence, using their answer. Then put only the recommended figure, or both figures, in the proposal. Do not put either figure in this guide.

SECTION: AiTC sales guide. Price. What you never do with a number. You do not invent a price to seem concrete. You do not copy a contract price from another company, or from a network-wide simulator purchase, and present it as the AiTC price. You do not offer a discount against a number you have not stated. You do not tell one organisation the figure you offered another. If a public source states someone else’s contract, that figure stays in their record as their published contract. It is not your licence fee.

SECTION: AiTC sales guide. The proposal. What it contains. A proposal after a successful trial contains these parts. The organisation and the lesson you trialled. The AiTC capabilities they actually saw. The licence shape you recommend, and why. The figure. What they need to start: a browser, their computers, and, if they want their airspace, the file. What happens next, which is a date to begin or a date to decide. It does not contain claims from this book that you did not show and cannot support.

SECTION: AiTC sales guide. The proposal. How you describe the product there. Use the same words as the product lessons. Radar and tower in the browser. Hardware-agnostic, not tied to one operating system. Airspace by hand or by artificial intelligence, from their file, with a country airspace possible within minutes. Exercises created and previewed in the platform. Assistant by voice or text, then manual placement of the conflict and the peak. Traffic load by sector. Scripts. Artificial intelligence piloting. Script replay, a hundred times smaller than video, and more. Voice, ground-to-air and ground-to-ground, and video for the remote instructor. Flight envelope, visible to the student. Cut any sentence they did not care about.

SECTION: AiTC sales guide. After the decision. If they want to proceed. Confirm the licence shape, the figure, and the start in writing. Repeat what the trial showed, so the agreement matches the demonstration. Ask for the airspace file if the work depends on it. Introduce only the next practical step. Do not reopen the entire product. The sale moved from attention to delivery.

SECTION: AiTC sales guide. After the decision. If they need time. Ask what the decision needs: another viewer, a tender date, or a budget meeting. Put that date in your notes. One follow-up at that date is enough, and it refers to the trial they already saw. Do not restart with the first-email text. They have already met the product.

SECTION: AiTC sales guide. After the decision. If the trial failed their question. Ask which part failed. If it was a capability AiTC has, offer a second sitting that shows that part. If it was a requirement this guide does not claim, say you cannot meet it and stop. Do not promise a feature in order to save the meeting. The product you sell is the product in these lessons.

SECTION: AiTC sales guide. The map. How the guide and the map work together. The organisation directory tells you the published mailbox, the city, and any published ATM system or simulator note. The map tells you whether you have written, and whether they have replied. This book tells you what to write. Before you draft, read all three. A beautiful email to the wrong address, or a first email to someone who already replied, wastes the method.

SECTION: AiTC sales guide. The map. What you record. When you send, the correspondence stores the subject and the message. When they reply, open the message and read it before you draft again. The pin stays green after you have read the reply, so a read reply is not mistaken for silence. Your next email should mention the thing they said. That is the marketing principle of relevance, applied to one organisation at a time.

SECTION: AiTC sales guide. Practice. Rewrite a feature as a buyer’s sentence. Take any product lesson in this book and write one sentence a training manager would care about. Example for replay: "You can debrief the lesson by reproducing the exercise, and you can keep many of those lessons because the recording is a script, not a video." Do this for airspace, for artificial intelligence piloting, and for the flight envelope. If the sentence contains a number you invented, delete it.

SECTION: AiTC sales guide. Practice. Choose the first email. Pick one organisation from the directory. Decide if it is an air navigation service, an academy, or a university. Choose one capability. Write the four-part email from the first-email lesson. Read it aloud. Cut until it takes under a minute. Check the map colour before you send. Black can receive a first email. Blue is already in the silence sequence. Green means you answer the reply you have.

SECTION: AiTC sales guide. Practice. Plan a trial from a reply. Imagine they reply, "Can our instructors run this without extra staff, on the PCs in the classroom?" Your plan: browser on their PC, one tower or radar lesson, artificial intelligence piloting, no pseudo-pilot in the room, preview of the conflict, and a question at the end: "Did this run without the extra person?" Write that plan in five lines. That is the demonstration discipline.

SECTION: AiTC sales guide. Practice. Explain the price without a number. Say the two shapes. Say which one you would recommend for a twelve-person course, and which one you would recommend for a whole academy. Do not say a currency amount. End with: "The figure goes in the proposal after we agree the shape." If you can do that aloud, you are ready for the price question.

SECTION: AiTC sales guide. Words you may use. You may say that AGI Aeronautics offers AiTC. You may say radar and tower run in the browser, on existing hardware, in any location, without dependence on one operating system. You may say airspace is created manually or with artificial intelligence from a simulator file, an aeronautical information publication, or another file that contains the airspace information, and that a country airspace can be created within minutes. You may say exercises are created and previewed in the platform.

SECTION: AiTC sales guide. Words you may use. The rest of the product. You may say the assistant takes voice or text requests for a number of aircraft, a route, or aircraft types, and that the creator then places the conflict and the traffic peak. You may say traffic load is visible per sector. You may say scripts drive aircraft automatically, and that artificial intelligence can pilot so a human pseudo-pilot is not required. You may say replay is a script, not video or audio, a hundred times smaller than video and more. You may say voice includes ground-to-air and ground-to-ground, and video lets a remote instructor see the trainee. You may say the flight envelope is detailed, graphical, and visible to the student inside the simulation.

SECTION: AiTC sales guide. Words you may not use. Do not state a price that is not in the proposal you are sending. Do not state a customer, a percentage, a time saving, or a certification that this book does not contain. Do not say a meeting is booked. Do not say they asked for a quote. Do not assign them an ATM system or a simulator vendor that their record does not publish. Do not say you have already written to them if the correspondence is empty. Do not say a personal mailbox is the institutional contact.

SECTION: AiTC sales guide. Closing. How you know you are ready. You are ready to sell AiTC when you can do four things without the book open. Say the one-sentence position. Choose one capability for one kind of buyer. Ask for a trial and stop. Explain per-user and organisation licences without inventing a figure. The rest of this book is there when they ask a harder question. Use it. Then write a short email.
